# AGENDA

1. Introduction

2. Object Detection with OpenCV

3. Model with OpenCV and Cascade Classifier

4. Convolutional Neural Networks

5. Object detection with YOLO

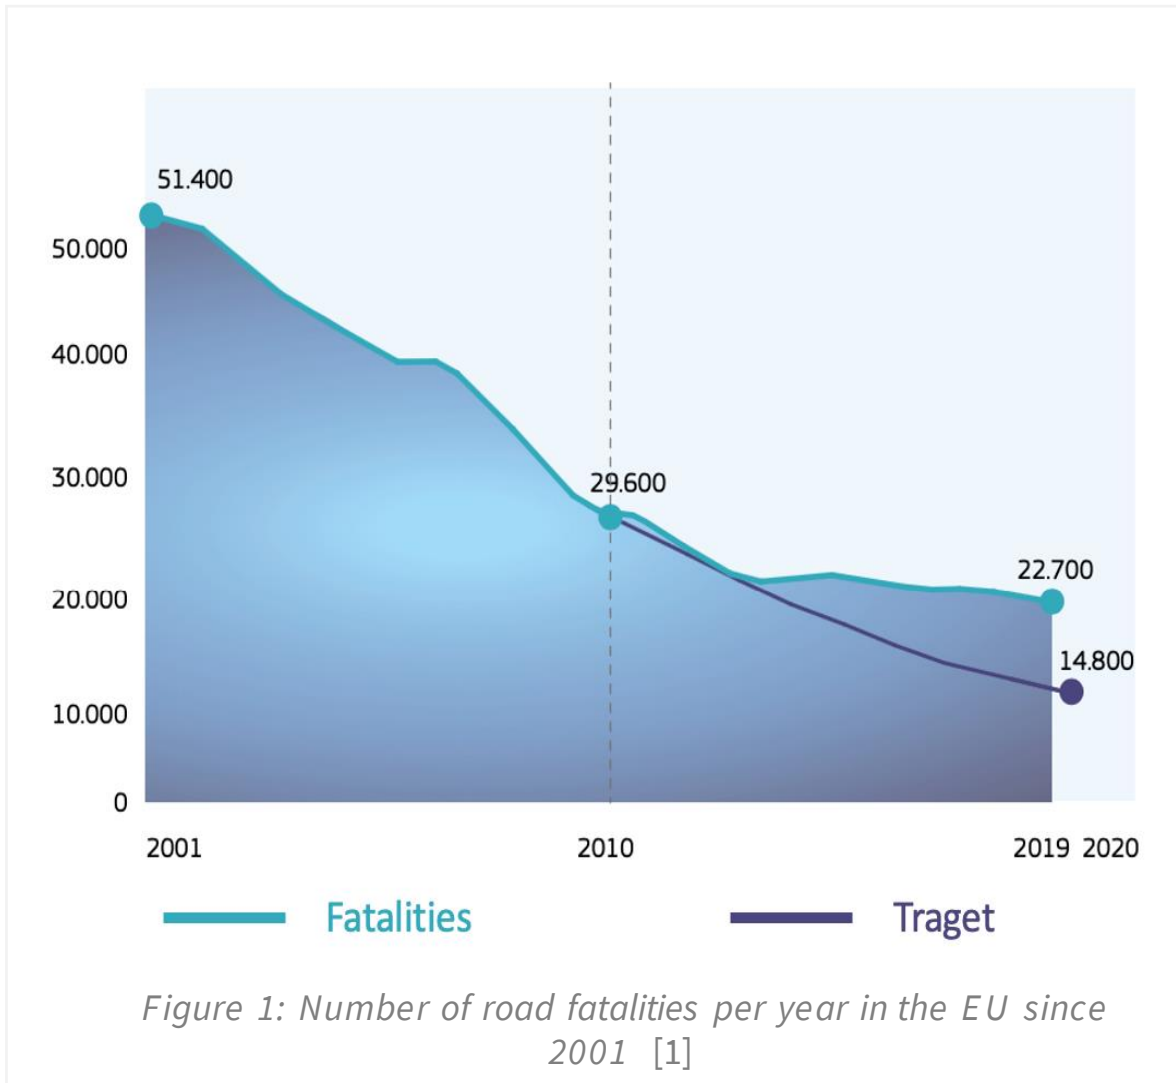

6. Model with YOLO

7. Conclusions

8. Q&A

# 1. INTRODUCTION

## COMPUTER VISION FOR ROAD SAFETY

### Road Safety:

- EU struggles to reach the target for road fatalities
- Since 2014 the slope for road fatalities curve started to flatten

### Computer Vision versus traditional safety systems:

- Most of traditional safety systems take action when the vehicle is in a dangerous situation
- Computer vision will avoid a dangerous situation in the first place by anticipation

# 1. INTRODUCTION

## LEVELS OF SELF DRIVING CARS

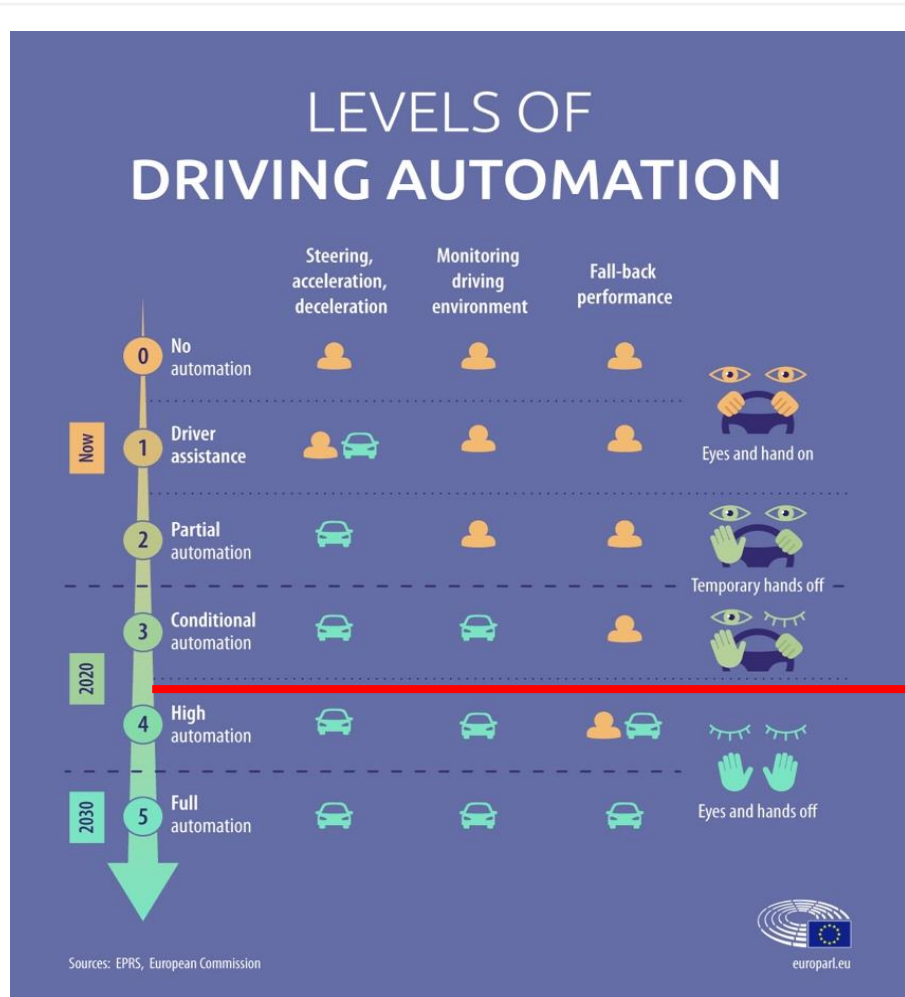

Figure 2 : Levels of driving automation [2]

Figure 3: Object detection on open road with computer vision using YOLO

# 1. INTRODUCTION

## COMPUTER VISION VERSUS LIDAR

Figure 4: Environment detection:  
Difference between LIDAR and image recognition [3]

### Computer Vision **advantages** over LIDAR:

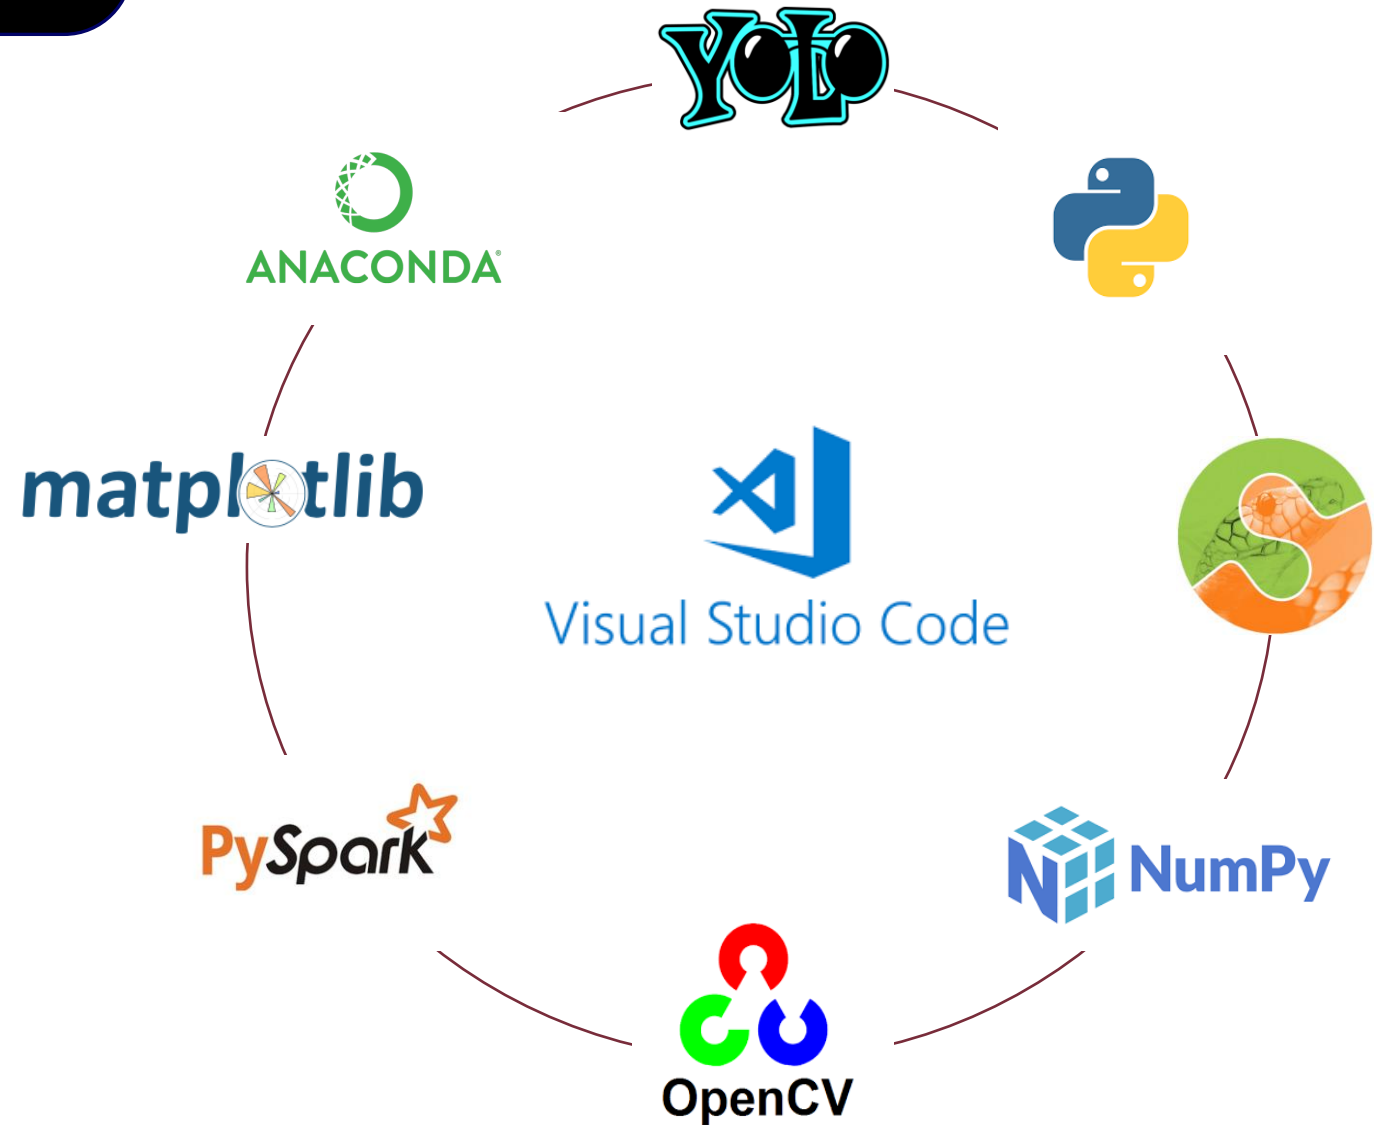

- Use current road infrastructure
- Less expensive than LIDAR \$7500 (around 6200 euros) [4]

### Computer Vision **disadvantages** compared to LIDAR:

- Weather conditions influence on object detection
- Processing 800 MB of raw data each second

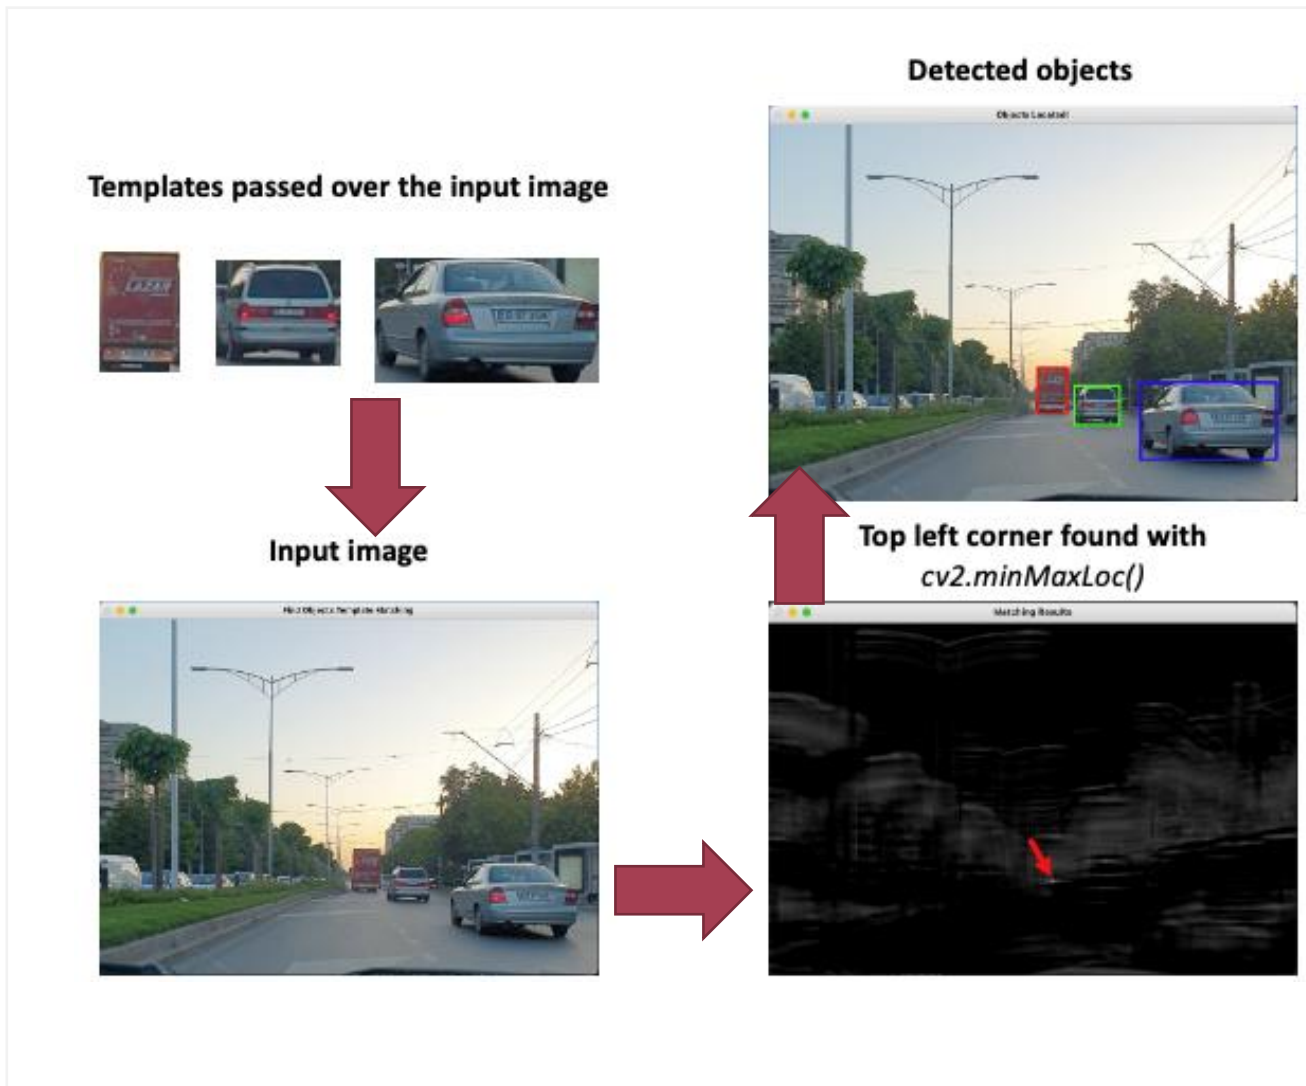

## 2. OBJECT DETECTION WITH OPENCV

MODEL:

## 2. OBJECT DETECTION WITH OPENCV

### VEHICLE DETECTION USING TEMPLATE MATCHING

#### Advantages:

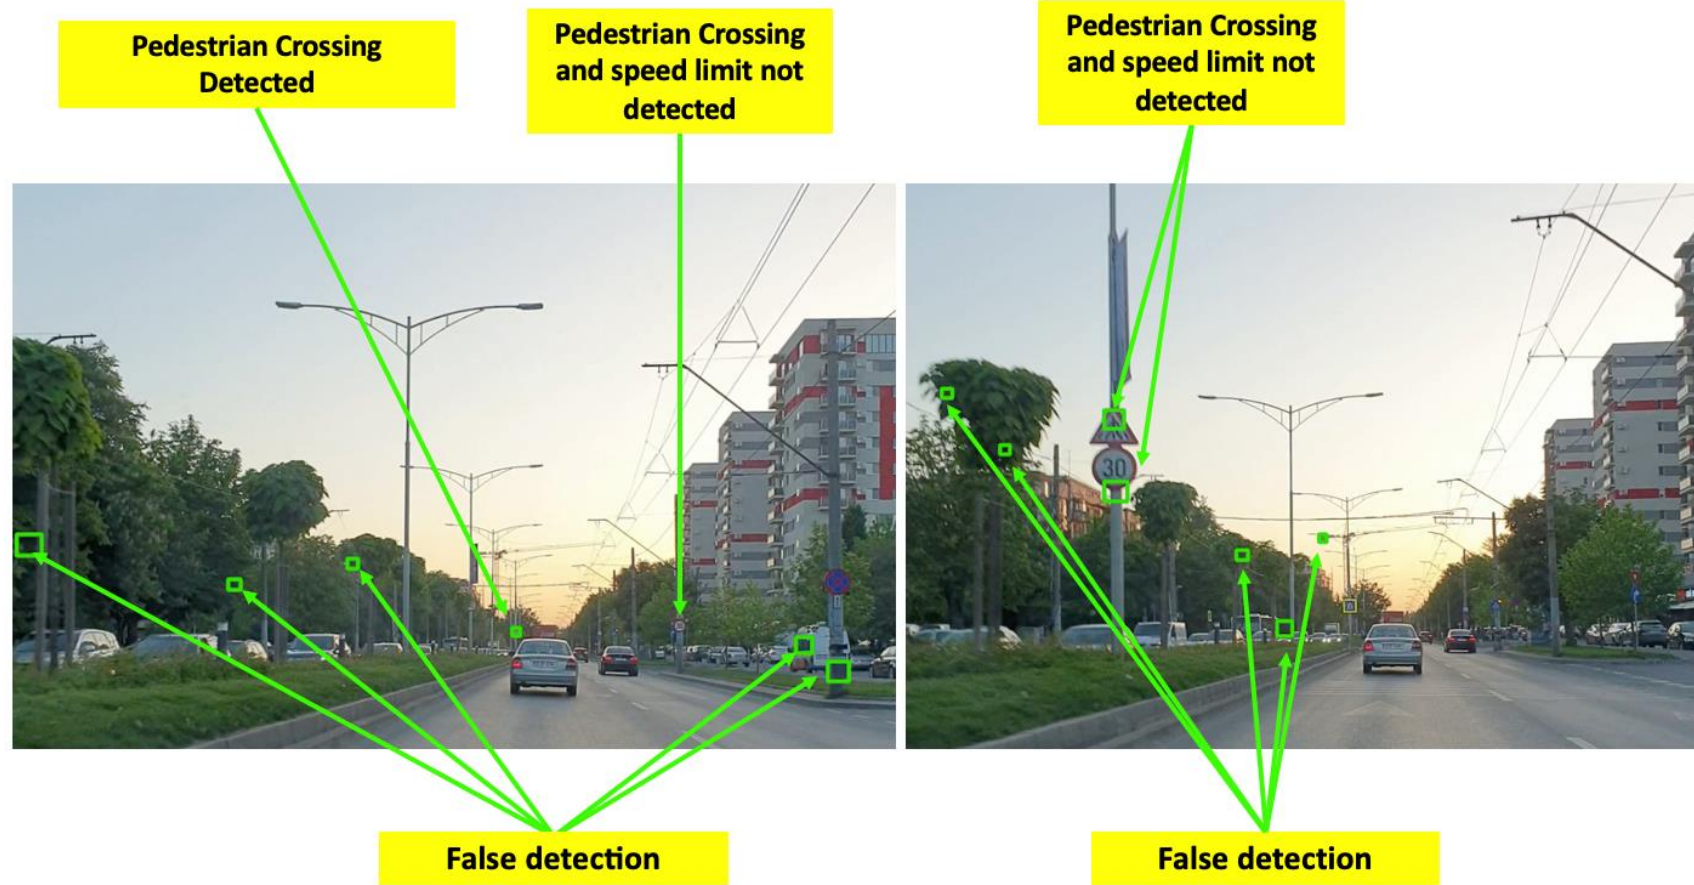

- Detection independent of the object position within the frame
- Fast and accurate method when detecting standard objects like traffic signs.

#### Disadvantages of template matching:

- The template and the input image must have the same orientation
- Image size and scale matters
- Driving conditions (weather – brightness and contrast) sensitiveness
- Perspective sensitiveness

## 2. OBJECT DETECTION WITH OPENCV

### TEMPLATE MATCHING AND PYRAMIDING FOR TRAFFIC SIGNS DETECTION

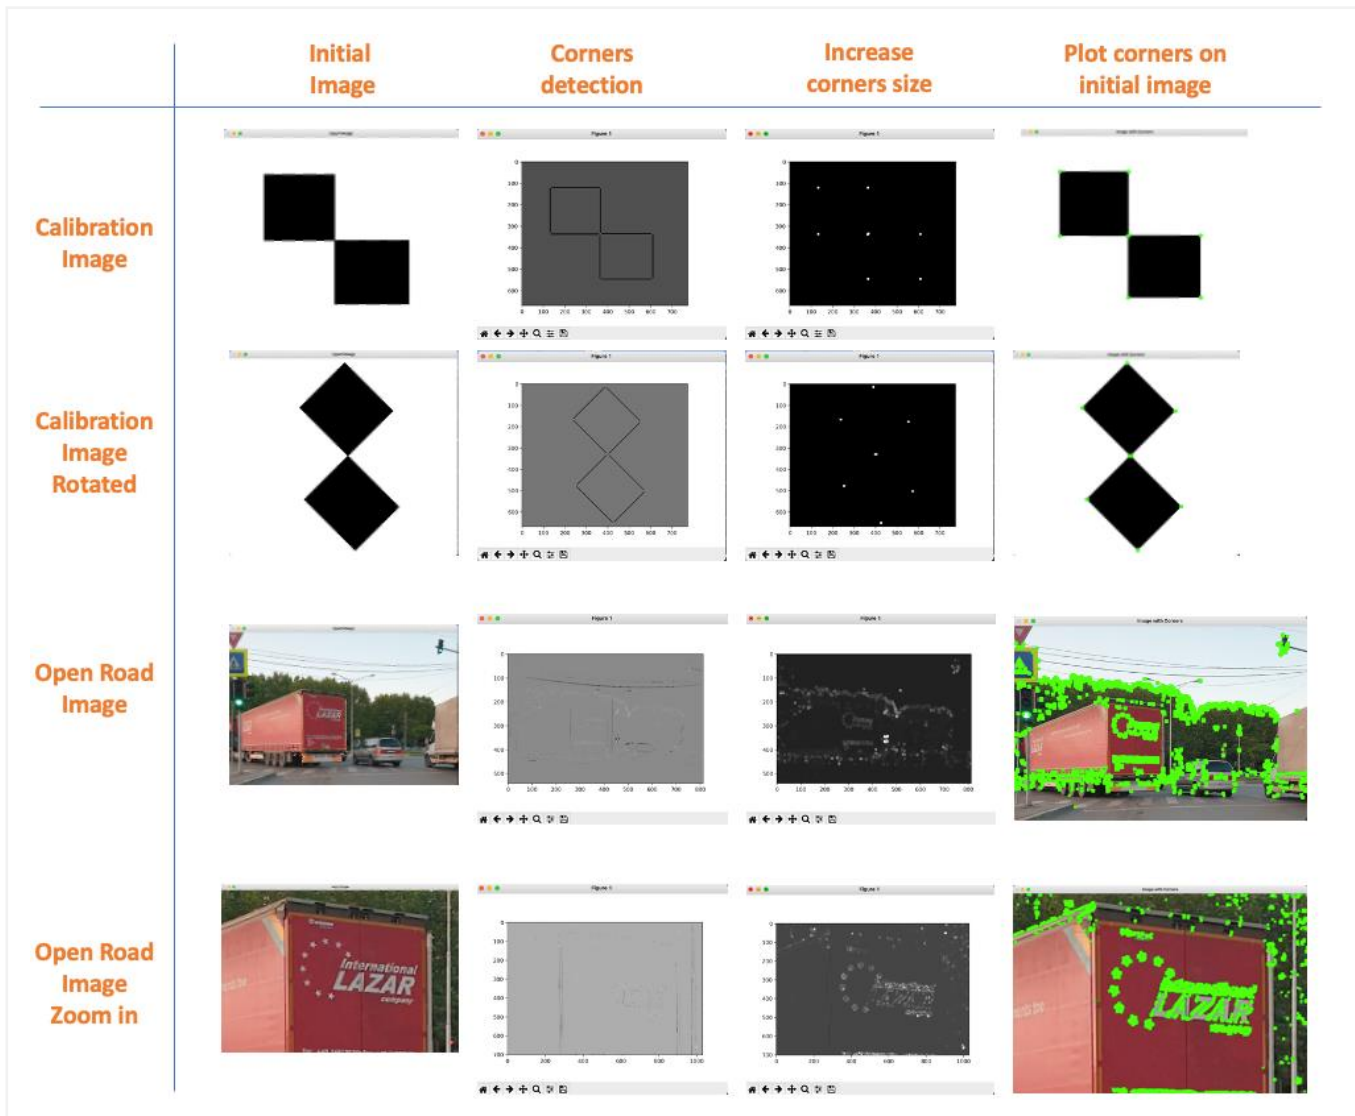

Applied together with pyramiding technique the template matching correct detection rate drops to 30 % in real driving conditions.

## 2. OBJECT DETECTION WITH OPENCV

### CORNER DETECTION USING CORNER HARRIS

#### Advantages

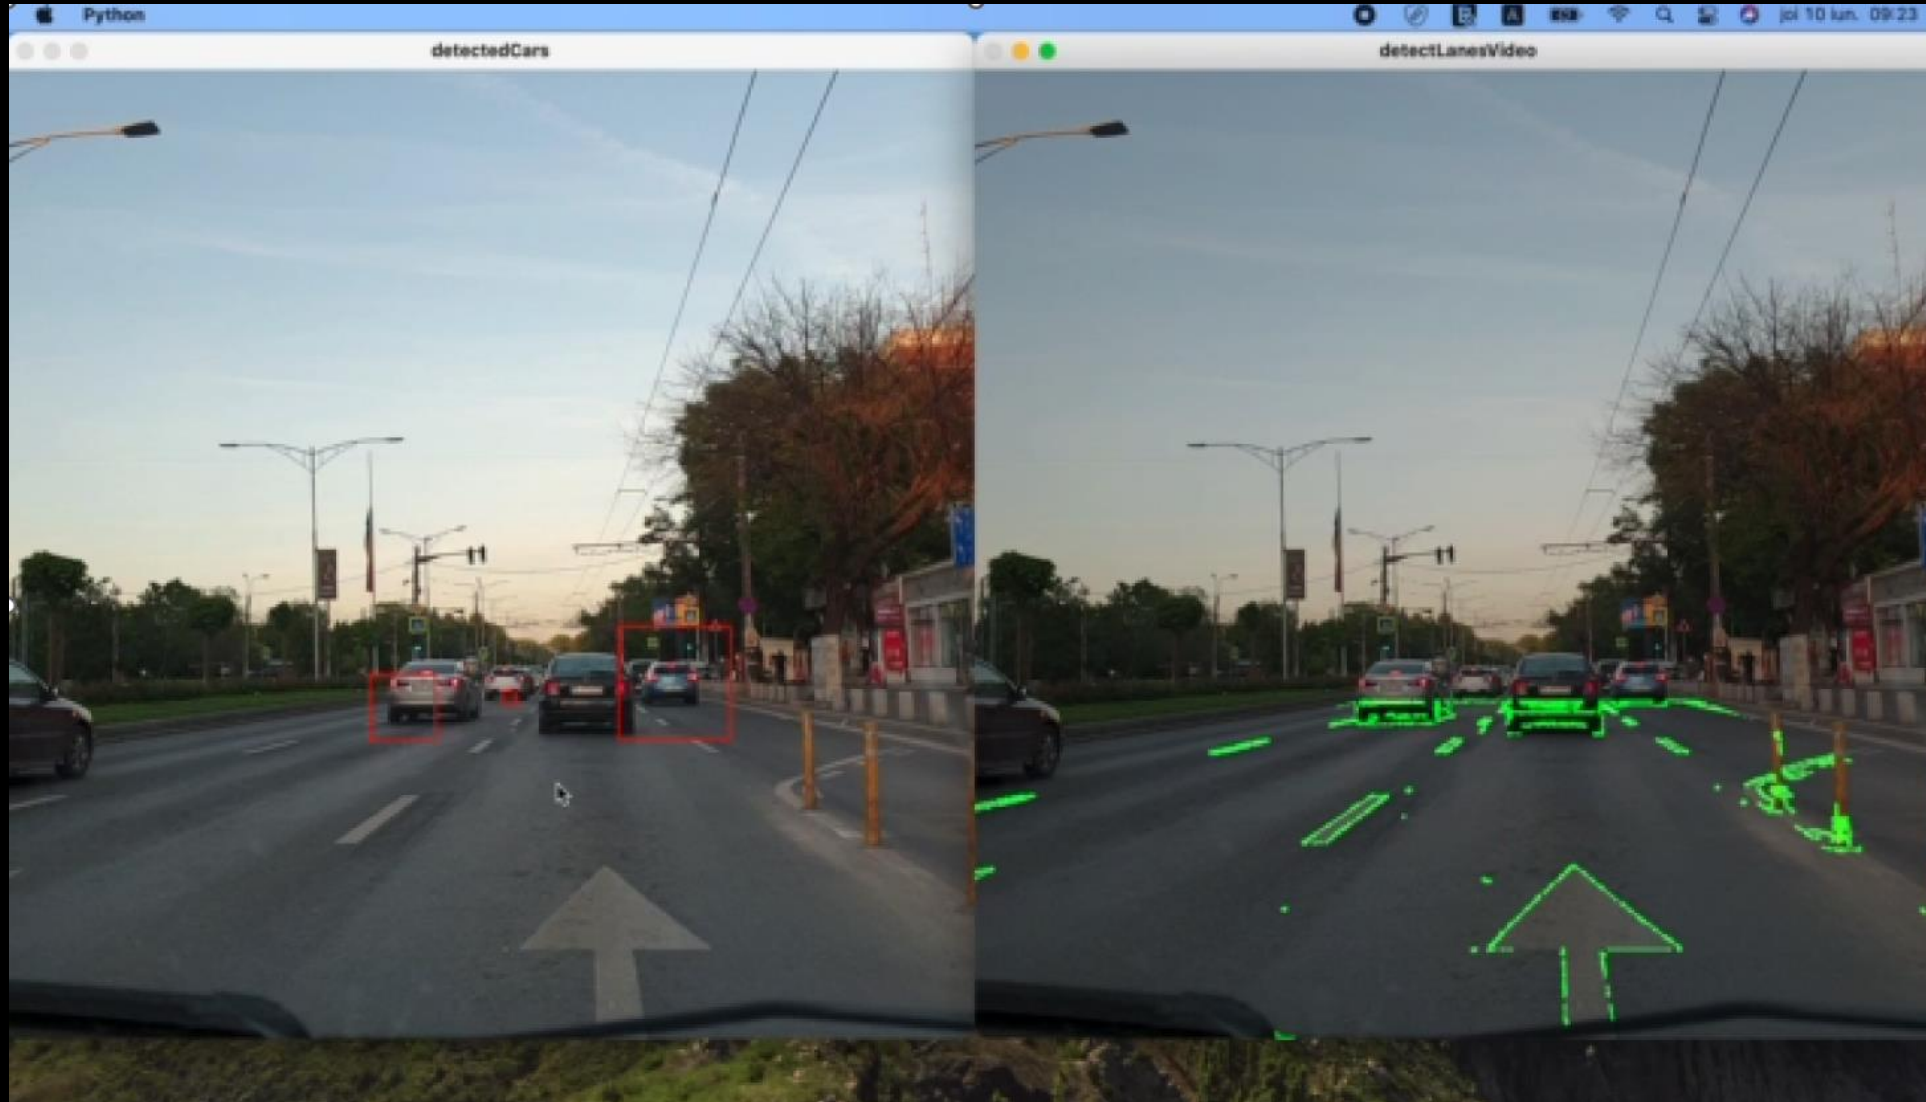

- Corner Harris method provides good results detecting corners in rotated images
- This method is suited to detect corners of objects captured from different perspectives

#### Disadvantages

- Does not provide accurate results when it comes to scaling images.
- A corner in a smaller image can result in multiple corners for the increased size image.

### 3. MODEL WITH OPENCV AND CASCADE CLASSIFIER

DRIVABLE SPACE AND VEHICLES DETECTION  
DURING REAL DRIVING ON OPEN ROAD

# 4. CONVOLUTIONAL NEURAL NETWORKS

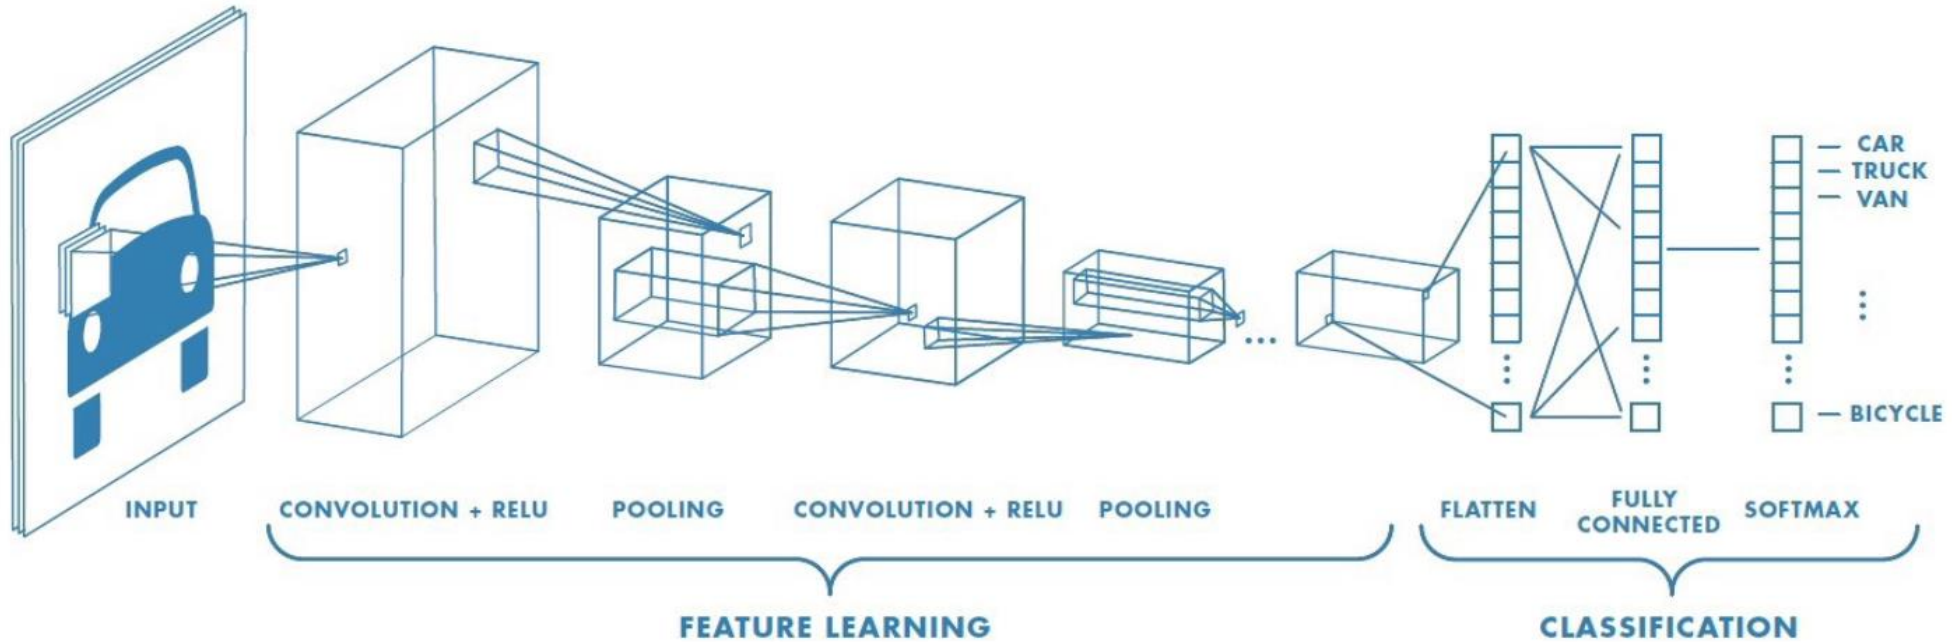

Figure 5 : CNN sequence [5]

## Convolutional layer:

Detects the features of objects like horizontal or vertical edges, corners and histograms of oriented gradients

On the output of the 1<sup>st</sup> operation, we produce another convolution to detect combinations of features

## Pooling layer:

Extract pixels values that are relevant for feature detection

## Classification layer:

Detects the object based on the input features

## 5. OBJECT DETECTION WITH YOLO

### OBJECT DETECTION SPEED FOR DIFFERENT COMPUTER VISION TECHNOLOGIES

	Pascal 2007 mAP	Speed		Travel distance at 50 km/h
<b>R-CNN</b>	66.0	.05 FPS	20 s/img	278 m
<b>Fast R-CNN</b>	70.0	.5 FPS	2 s/img	28 m
<b>Faster R-CNN</b>	73.2	7 FPS	140 ms/img	1,9 m
<b>YOLO</b>	63.4	45 FPS	22 ms/img	0,3 m

Figure 6: YOLO object detection speed and average precision compared with other CNNs [7]

Using YOLO, a vehicle traveling at 50 km/h will cover just 0,3 m until it detects an object

The average human driver reaction time is around 1800 ms [6]

YOLO detection speed of just 22 ms leaves plenty of time for the other components involve in the system like braking and steering to react in the same amount of time as human driver.

## 6. MODEL WITH YOLO

### YOLO DETECTION METHOD

#### YOLO method

- The algorithm divides and analyses all parts of the images to detect the objects.
- The algorithm needs to decide in what part of the image the object is found and where is the center of the object in order to draw the bounding box

#### Drawbacks

- Output more than one bounding boxes for one object, because the object is splitted among parts of the entire image that are analyzed separately.

## 6. MODEL WITH YOLO

### YOLO APPLIED ON A SINGLE FRAME

Result without NMS function

Result with NMS function

Non-Maximum Suppression method removes all, but the maximum confidence detection therefor the output will be consisted of a single bounding box.

## 6. MODEL WITH YOLO

The image shows a VS Code editor window with the following components:

- EXPLORER:** Shows a file tree for a workspace named 'PYSARK\_ENV'. Files include 'pedestrian.xml', 'RoadVideo\_480p\_12fps\_short.mp4', 'RoadVideo\_480p\_12fps.mp4', 'RoadVideo\_480p.mov', 'RoadVideo1.mp4', 'RoadVideo2\_480p.mov', 'RoadVideo2.mp4', 'RoadVideo3.mp4', 'SVM.py', 'Template matching input\_grey.jpg', 'Template matching input.png', 'Template\_1.png', 'Template\_2.png', 'Template\_3.png', 'TemplateMatching.py', 'test.py', 'TrafficSignDetectionFromVideo.py', 'Yolo\_image\_NMS.py', and 'Yolo\_image.py'.
- OPEN EDITORS:** Shows several tabs, with 'Yolo\_video\_NMS .py' selected.
- EDITOR:** Displays the code for 'Yolo\_video\_NMS .py'. The code includes:

```
90     boxEnd_Y = boxStart_Y + boxHeight
91
92     #get box colors
93     boxColor = colors[predictedClassId]
94     boxColor = [int(c) for c in boxColor]
95
96     #print the label and the confidence
97     predictedClassLabel = "{}: {:.2f}%".format(predictedClassLabel, predictionConfidence)
98     print("predicted object {}".format(predictedClassLabel))
99
100    #draw rectangle and add label text
101    cv2.rectangle(outputImage, (boxStart_X, boxStart_Y), (boxEnd_X, boxEnd_Y), boxColor, 2)
102    txtPosition = (boxStart_X, boxStart_Y-5)
103    txtFont = cv2.FONT_HERSHEY_PLAIN
104    txtScale = 0.5
105    txtColor = boxColor
106    txtThickness = 1
107    cv2.putText(outputImage, predictedClassLabel, txtPosition, txtFont, txtScale, txtColor, txtThickness)
108
109
110    myCodec = cv2.VideoWriter_fourcc(*'MPEG')
111    out = cv2.VideoWriter('YOLO_pretrained_detection.mp4', myCodec, 24, (480, 480))
112    out.write(outputImage)
113
114    cv2.imshow("Detected Objects:", outputImage)
115    if cv2.waitKey(1) & 0xFF == ord('q'):
116        break
```
- TERMINAL:** Shows a 'zsh' shell prompt in a 'pyspark\_env' environment.
- PROBLEMS:** Shows the message 'No problems have been detected in the workspace.'

The screenshot displays a VS Code workspace for a computer vision project. The Explorer sidebar on the left shows a file tree for a project named 'PYSARK\_ENV', containing various video files (e.g., 'RoadVideo\_480p\_12fps\_short.mp4') and Python scripts (e.g., 'Yolo\_image.py'). The central editor area shows a video frame with a 'Detected Objects:' window overlaid, displaying a street scene with red bounding boxes around several cars and a bus. The Output console on the right shows terminal logs with object detection confidence scores for various vehicles.

```

```

## 7. CONCLUSIONS

Computer vision progress in terms of speed and accuracy of detection and localization have increased the adoption of this technology for self driving cars

Machine learning models require a lot of data to be trained but they can become more and more accurate and work in poor visibility condition

If a human can label an object within an image a machine learning model can be trained to detect it

### Next steps

Study the distance measuring using computer vision only through triangulation and over LIDAR technology advantage on computer vision
